

ABSTRACT

A film for a liquid crystal display. The film is a cellulose ester film with a thickness between 20 and 65 μm and containing fine particles. The average diameter of fine particles is 0.05 to 3.0 μm . The number of fine particles per 1,000 μm^2 is 5 to 500 in the cross-section perpendicular to the cellulose ester film in a region of a depth of not more than 10 μm .
